Aman Threshold Backtest Summary

Generated: 2026-07-22

Backtest Scope

- Source: Mongo OHLC backtest, final v11 candidate sweep
- Coverage: 597 eligible tickers, 4,250,370 accepted OHLC rows, 57,793 social docs, 7,555 catalyst docs
- Execution: signal at end of minute t, entry at next real bar close, 3% protective stop, end-of-day flatten
- Aman baseline: Mega 240m/C=0.10/3% trail; Large 480m/C=0.10/2% trail; Mid 60m/C=0.30/2% trail; Small 240m/C=0.10/2% trail; Nano 60m/C=0.10/5% trail

Aman Baseline Results

Tier	Trades	Win Rate	Mean Net	Median Net	Profit Factor	Max DD
Mega	21	38.10%	+0.7037%	-0.1275%	1.5685	-11.4406
Large	1	100.00%	+0.3109%	+0.3109%	n/a	0.0000
Mid	9	55.56%	+0.3622%	+0.3198%	1.5215	-4.8109
Small	1	0.00%	-0.0429%	-0.0429%	0.0000	-0.0429
Nano	31	9.68%	-2.0782%	-3.9000%	0.2815	-64.4241
Overall exact tier mix	63	31.75%	-0.7320%	mixed	weak	dragged down by Nano

Readout: Aman's larger-cap rules were not terrible, but the exact submitted set fails as a total policy because Nano generated almost half the trades and was strongly negative.

Best Promoted Rule

Selected live profile: float_guarded_w120_c0.38_pre60le4_msg3_partial50_runner_v11

- Entry: 120m rolling corr(price, message density) crosses above 0.38
- Pre-entry control: prior 60m return must be $\leq +4\%$; active move gate: session change must be between 0% and 12%
- Message/float guard: at least 3 trailing-60m messages; low-float/Nano rows need catalyst, positive social support, or short-interest support
- Exit: sell 50% at +5%; hold the runner until it gives back 5% after reaching +10%; keep 3% protective stop and flatten end of day

Rule	Trades	Win Rate	Mean Net	Median Net	PF	Max DD
Promoted v11, controlled momentum	30	66.67%	+1.6465%	+0.8541%	3.0116	-7.8000
Same v11 gate, full runner	30	63.33%	+2.0447%	+0.8541%	3.1558	-7.8000
Broader any-momentum companion	89	50.56%	+0.9534%	+0.1000%	1.6963	-17.2000
Stricter pre60 ≤ 1 companion	60	45.00%	+1.6572%	-0.1274%	2.0447	-17.4133
Current live v10 runner, any momentum	28	50.00%	+3.4193%	+0.0744%	3.6036	-11.9090

Recommendation: promote v11 instead of chasing the 28-trade high-mean current-live variant. The current-live runner has higher average return, but the median is barely positive and trade count is thinner. The v11 controlled-momentum profile has the cleaner win rate, positive median, smaller drawdown, and still strong expectancy.

Conclusion

Aman's thresholds identified some valid larger-cap setups, but the full submitted policy is not ready to run unchanged because Nano was deeply negative and dominated the sample. The improved v11 policy is materially better: +1.6465% mean net per trade, 66.67% win rate, 3.0116 profit factor, and -7.8 max drawdown in the selected final-candidate sweep. I would present v11 as the stronger policy while noting that live monitoring should continue before widening the gate.
